Summary

Full-stack Software Engineer with over 2 years of production experience building and evolving a company-wide KPI analytics platform used across all clients, in **Java**, **Elasticsearch**, **Redis**, and **Netty**, with additional experience in Python (**FastAPI**), **React**, and **Next.js**. Proven track record independently owning features end-to-end — from real-time data pipelines to full-stack UI — cutting job runtimes by ~90%, achieving sub-300ms query latency at scale, and automating manual operational workflows.

Work Experience

Software Engineer, Salescode.ai

Aug 2024 - Present

KPI Analytics & Dashboard Platform (SalesLens), used company-wide across all clients | Gurugram, Haryana

- Promoted from **Trainee to Software Engineer within 6 months** and awarded the **Lead Performer Award (2025)** for delivering scalable backend solutions and measurable platform improvements.
- Solved a data-scale problem the platform had no precedent for: designed a **pivot index strategy** on Elasticsearch to compute user-location-division level KPI metrics from launch to date, supporting independent and combined filtering with real-time updates under **300ms**.
- Own the platform's core computation pipeline — a 30-second polling scheduler that detects new orders, streams raw data into Elasticsearch, and triggers real-time in-memory calculation of launch-till-date KPIs (total order amount, onboarded outlets) with no batch delay.
- Replaced a static, non-customizable Kibana dashboard with a **runtime query aggregation API**, and introduced in-memory Redis caching that cut typical API latency from **700-800ms to under 200ms** across custom per-client dashboards querying **2 years of historical data**.
- Rebuilt a slow-running KPI pipeline consuming the ML team's S3-based recommendation output, cutting job runtime from **30-40 minutes to 3-5 minutes (~90% reduction)**.
- Closed a key visibility gap the platform had lacked since launch: built a designation/year/period-wise KPI attribution view with Excel export, giving leadership visibility into individual and team contribution for the first time; extended KPI computation to **daily-level granularity**.
- Automated a fully manual, copy-paste poster creation workflow into a self-serve, configurable builder for business analysts (DynamoDB config, Puppeteer + Nodemailer delivery), **eliminating manual effort** beyond initial configuration.
- Built an **automated test suite** validating KPI outputs against underlying database queries and API responses, reducing manual effort for testing across releases.
- Automated KPI batch processing via **Jenkins CI/CD**, replacing manual runs and improving reliability of scheduled data pipelines.

Relevant Projects

Insight Hub – GitHub Analytics Platform

[GitHub](#) | [Live](#)

FastAPI, Next.js, PostgreSQL, Redis, GraphQL, OAuth2/JWT

- Built an async FastAPI backend querying GitHub's GraphQL API, using Redis caching to reduce redundant calls and keep response times low.
- Implemented dual-LLM failover logic and cross-domain OAuth2 + JWT authentication between separately hosted frontend and backend services, ensuring resilient access to user GitHub data.
- Developed a responsive Next.js frontend presenting LLM-generated insight reports through interactive, structured data visualizations.

Real-Time Event Processing Platform

[GitHub](#)

Java, Spring Boot, PostgreSQL, Redis, Kafka, Prometheus, Grafana

- Self-directed exploration of distributed-systems patterns not used in my day-to-day stack: architected an event-driven microservices system with separate producer, consumer, and monitoring services using Kafka pipelines with retry logic, idempotency handling, and fault tolerance.
- Designed asynchronous workflows to improve throughput under load; instrumented services with Prometheus and Grafana for real-time observability.

Education

Guru Tegh Bahadur Institute of Technology 2021 - 2025

Bachelor of Technology, Information Technology | CGPA: 9.04 | New Delhi, India

Technical Skills

Languages: Java, Python, JavaScript, TypeScript, Go

Backend & Microservices: Spring Boot, Netty, REST APIs, Microservices Architecture, FastAPI, Node.js

Frontend: React.js, Next.js

Data & Messaging: Elasticsearch, Apache Kafka, Redis, PostgreSQL, MySQL, DynamoDB, AWS S3

DevOps & Tooling: Jenkins CI/CD, Docker, Puppeteer, Git, Prometheus, Grafana

Practices: Event-Driven Design, Distributed Systems, Code Review
