SUMMARY

Software Engineer with 2+ years of production Java experience owning a company-wide KPI analytics platform end-to-end across AWS, Elasticsearch, Redis, and Kafka. Cut a core data pipeline's runtime by 90% (30-40 min to 3-5 min), brought dashboard API latency down from 700-800ms to under 200ms, and engineered a real-time KPI engine serving sub-300ms queries at scale. Extends the same backend depth into Python (FastAPI) outside of core Java work.

EDUCATION

B.Tech, Information Technology - Guru Tegh Bahadur Institute of Technology | 2021 - 2025

CGPA: 9.04 · New Delhi, India

WORK EXPERIENCE

Software Engineer - Salescode.ai | Aug 2024 - Present

KPI Analytics & Dashboard Platform (SalesLens) · Gurugram, Haryana

- Rebuilt a slow-running KPI pipeline consuming ML-generated data from AWS S3 that was delaying downstream KPI availability, **cutting runtime from 30-40 minutes to 3-5 minutes (90% reduction)** and giving business teams same-day access to fresh recommendations
- Replaced a static, non-customizable Kibana dashboard with a runtime query aggregation API and Redis caching to support per-client dashboard customization, **cutting typical API latency from 700-800ms to under 200ms** across 2 years of historical data
- Designed a pivot index strategy on Elasticsearch to solve a data-scale problem the platform had no existing solution for, enabling **real-time user-location-division KPI updates under 300ms** with independent and combined filtering
- Engineered and own a 30-second polling scheduler that detects new orders and triggers real-time in-memory KPI calculation, eliminating batch delay so order and outlet numbers shown to clients are always current
- Deployed and maintain SalesLens backend services on **AWS EC2** to keep the platform reliably available company-wide across all clients
- Automated a fully manual, copy-paste poster-creation workflow into a self-serve builder (**AWS DynamoDB** for configuration, Puppeteer + Nodemailer for delivery), removing repetitive manual effort for business analysts beyond initial setup
- Delivered a designation/year/period-wise KPI attribution view with Excel export to close a visibility gap the platform had lacked since launch, giving leadership insight into individual and team contribution for the first time
- Moved KPI batch processing onto Jenkins CI/CD to replace error-prone manual runs, improving the reliability of scheduled data pipelines

ACHIEVEMENTS

- **Lead Performer Award (2025)**, Salescode.ai - for independently designing and delivering the platform's custom KPI computation logic single-handedly

PROJECTS

Insight Hub - GitHub Analytics Platform | [GitHub](#)

Python (FastAPI), Next.js, PostgreSQL, Redis, GraphQL, OAuth2/JWT

- Built an async FastAPI backend querying GitHub's GraphQL API to power repo-level analytics, using Redis caching to cut redundant calls and keep response times fast for users
- Implemented dual-LLM failover logic and cross-domain OAuth2 + JWT authentication between separately hosted frontend and backend services, so access to user GitHub data stays resilient if one LLM provider fails
- Shipped a Next.js frontend to present LLM-generated insight reports through interactive, structured visualizations, making complex repo analytics easy to interpret at a glance

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, TypeScript, Go

Backend: Spring Boot, Netty, FastAPI, REST APIs, Microservices

Data, Messaging & Cloud: Elasticsearch, Kafka, Redis, PostgreSQL, MySQL, AWS EC2, AWS DynamoDB, AWS S3

Tooling: Jenkins CI/CD, Docker, Git
